                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 6, Application US/08689276A

Sequence 6, Application US/08689276A

Patent No. 5891991

GENERAL INFORMATION:
APPLICANT: Wasco, Wilma
APPLICANT: Bupp, Keith
APPLICANT: Applicant: Margaret
APPLICANT: Applicant: Margaret
APPLICANT: Applicant: Tanzi, Margaret
APPLICANT: Applicant: Solomon, Frank
TITLE OF INVENTION: AMTIOID PRECURSOR-LIKE PROTEIN AND USES
TITLE OF INVENTION: THEREOF
NUMBER OF SEQUENCES: 19
CORRESPONDENCE ADDRESS:
ADDRESSEE: Sterne, Kessler, Goldstein & Fox P.L.L.C.
STREET: Mashington
CITY: Washington
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Score 29; DB 2; Length 190;

Sequence 28, Application US/08903139B

Patent No. 6114118

GENERAL INFORMATION:

APPLICANT: Joe W. Templeton, Jianwei Feng, L. Garry Adams,

APPLICANT: Erwin Schurr, Philippe Gros, Donald S. Davis and Roger Smith

TITLE OF INVENTION: METHOD OF IDENTIFICATION OF ANIMALS

TITLE OF INVENTION: RESISTANT OR SUSCEPTIBLE TO DISEASES SUCH AS RUMINANT

TITLE OF INVENTION: BRUCELLOSIS, TUBERCULOSIS, PARATUBERCULOSIS AND SALMONBLLOSIS

CORRESPONDENCE ADDRESS:

0
           The invention relates to diagnosing cancer especially ovarian cancer, by screening for stratum corneum chymotrypsin enzyme (SCCE). Proteases are considered to be an integral part of tumour growth and metastasis, and therefore, markers indicative of their presence or absence are useful for the diagnosis of cancer. The method is useful for diagnosing cancer, carcinoma and malignant hyperplasia. The SCCE ollagourcleotide may be used to treat a cancer selected from ovarian, breast, lung, colon, prostate and other cancers in which SCCE is overexpressed. The present sequence is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymersae chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). It is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as food supplement. (II) and its binding partners are useful in medical and so stores involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in
                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess

diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The enzyme encoded by this sequence is used in pharmaceutical, cosmetic

                                                                                                                                                                                                                                                                                                                                                       Human amyloid precursor protein protease (AAW05383) is involved in the processing or clearance of amyloid precursor protein to form beta-amyloid peptide. Its amino acid sequence was deduced from a cDNA clone (AAT39783) obtd. from a human lung library. Recombinate protease can be produced in transformed or transfected prokaryotic (partic. E. coli) or eukaryotic (partic. AV-120 host cells. It is used to develop products for the design and testing of cpds. useful for treating or preventing conditions associated with beta-amyloid peptide, esp. Alzheimer's disease.

The present sequence is human stratum corneum chymotryptic enzyne (HSCEE), a member of the kallikrein multi-gene family. Kallikreins and kallikrein-like protease enzyme family. They catalyse the selective cleavage of specific polypeptide precursors to release peptides with potent biological activity. Nucleic acids encoding Rallikrein-like proteins RKFLLI, KIK-LZ, KKR-LZ, KKL-LZ, KKR-LZ, KKR-LZ, KKR-LZ, CATA, KKL-LZ, KKR-LZ, They can also been isolated. The proteins are useful in the treatment, monitoring and diagnosis of cancers, especially prostrate cancer. They can also be used to identify a substance that can associate with or mediate the biological activity of the proteins. Antibodies and be used to treat conditions mediated by the kallikrein-like proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Stratum corneum chymotrypsin enzyme; SCCE; cytostatic; vaccine; tumour; cancer; ovarian; breast; lung; colon; prostate; carcinoma; human; antisense therapy; malignant hyperplasia.

The invention relates to diagnosing cancer especially ovarian cancer, by screening for stratum corneum chymotrypsin enzyme (SCCE). Proteases are considered to be an integral part of tumour growth and metastasis, and therefore, markers indicative of their presence or absence are useful for the diagnosis of cancer. The method is useful for diagnosing cancer, carcinoma and malignant hyperplasia. The SCCE oligonucleotide may be used to treat a cancer selected from ovarian, breast, lung, colon, prostate and other cancers in which SCCE is overexpressed. The present sequence is
                                                                                                     Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haemacopolesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity, and activity and activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Stratum corneum chymotrypsin enzyme; SCCE; cytostatic; vaccine; tumour; cancer; ovarian; breast; lung; colon; prostate; carcinoma; human; antisense therapy; malignant hyperplasia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human stratum corneum chymotrypsin enzyme peptide #5 (residues 6-14).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Diagnosing cancer comprises detecting stratum corneum chymotrypsin

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       á
                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                The invention relates to diagnosing cancer especially ovarian cancer, by screening for stratum corneum chymotrypsin enzyme (SCCE). Proteases are considered to be an integral part of tumour growth and metastasis, and therefore, markers indicative of their presence or absence are useful for the diagnosis of cancer. The method is useful for diagnosing cancer, carcinoma and malignant hyperplasia. The SCCE oligonucledctide may be used to treat a cancer selected from ovarian, breast, lung, colon, prostate and other cancers in which SCCE is overexpressed. The present sequence is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AAO00010-AAO13910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  22-AUG-2000;
                                                                         09-AUG-2001
   The invention relates to diagnosing cancer especially ovarian cancer, by screening for stratum corneum chymotrypsin enzyme (SCCE). Proteases are considered to be an integral part of tumour growth and metastasis, and therefore, markers indicative of their presence or absence are useful for the diagnosis of cancer. The method is useful for diagnosing cancer, carcinoma and malignant hyperplasia. The SCCE oligonucleotide may be used to treat a cancer selected from ovarian, breast, lung, colon, prostate and other cancers in which SCCE is overexpressed. The present sequence is human SCCE peptide.
                                                                                                                                                                                                                                                    Stratum corneum chymotrypsin enzyme; SCCE; cytostatic; vaccine; tumour; cancer; ovarian; breast; lung; colon; prostate; carcinoma; human; antisense therapy; malignant hyperplasia.
                                                                                                                                                                                                                    Human stratum corneum chymotrypsin enzyme peptide #85 (residues 2-10).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; immune; haematopoietic; immune/haematopoietic antigen; cancer; cytostatic; gene therapy; vaccine; metastasis.

```

(HUMA-) HUMAN GENOME SCI INC.

```
AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (I)
amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic
activity, and can be used in gene therapy and vaccine production. (I)
proteins and polynucleotides may be used in the prevention, diagnosis and
treatment of diseases associated with inappropriate (I) expression. For
expression by rectifying mutations or deletions in a patient's genome
cyplement the patients own production of (I). Additionally, (I)
cyplement the patients own production of (I). Additionally, (I)
cyplement the patients own production of (I). Additionally, (I)
cyplement caids into a host cell and culturing the cell to express the
protein. (I) proteins and polynuclectides may be used to prevent,
diagnose and treat immune/haematopoietic-related diseases, especially
concers and cancer metastases of haematopoietic antigen genomic
concers and cancer metastases of haematopoietic antigen genomic
sequences from the present invention. AAK54921 to AAK54950 and AAM82169
crepresent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

                                                                                                        The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as (II). (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. (II) and its binding partners are useful for treating diagnostics, forensics, gene mapping, identification of mutations cresponsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences of the invention.

Note: The sequence data for this patent did not appear in the printed sequence of the invention of intectly from MIPO of the invention of the in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ó

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequences AAB37984-B38019 represent the amino acid sequences of 27 human secreted proteins encoded by the genes AAC69084-C69119. The genes and proteins are useful for preventing, ameliorating or treating medical conditions, e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (antigonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer, and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New nucleic acid molecules encoding 27 human secreted proteins for diagnosing, preventing, treating or ameliorating medical conditions and used as food additives or preservatives -
                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Fragment of human secreted protein encoded by gene 18 clone HKAFH74.
for production of antibodies useful in the diagnosis and monitoring of liver cancer
                                                                                                                               expression in liver cancer tissue. Anti-CRTI antibodies or CRTI cDNA can be used to detect or assay for CRTI or CRTI mRNA, indicating in which tissues CRTI expression is elevated, and therefore allowing liver cancer to be diagnosed and monitored.
                                                                                                                                                                                                                                                                                                                  ö

The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, hemmatopolesis regulating activity, issue growth factor activity, immunomodulatory activity and activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, colypeptide (II) sequences. (I) is useful as hybridisation probes, colymucleotides are also used in diagnostics as expressed sequence tags and gene mapping, and in recombinant production of (II). The colynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene tharapy techniques concretion or treat disease states involving concretion are in the subject of sites expressing in the binding partners are useful in medical imaging of sites expressing (II). (I) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations cresponsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and companion and acid sequences. Absoloolio-AbsG30377 represent novel human diagnostic amino acid sequences of the invention.

Conditional condition is patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       polypeptide (II) sequences. (I) is useful as hybridisation probes, and double and polymerse chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags to restore normal activity of (II) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations are possible for genetic disorders or other traits to assess biodiversity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention.

Note: The sequence data for this parent did not appear in the printed specification, but was obtained in electronic format directly from WIPO

AAB63232 to AAB63467, AAB63468 to AAB63721 and AAB63722 to AAB63970 represent human breast, gastric and prostate CAAP protein sequence respectively. CAAPs have cytostatic activity and can be used in the production of cancer vaccines. The human CAAP proteins, peptides, nucleic acids or anti-CAAP antibodies are useful for diagnosing and treating a condition characterised by expression of an abnormal amount of a protein,
                                                                                                                                                                    Human gastric cancer associated antigen protein sequence SEQ ID NO:942.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Nucleic acids encoding breast, gastric and prostate cancer associated antigen precursors, useful for diagnosing and treating a condition characterized by expression of an abnormal amount of a protein, e.g.

AAF22422 to AAF22626, AAF22627 to AAF22773 and AAF22774 to AAF23014 represent nucleotide sequences encoding human breast, gastric and prostate cancer associated antigen precursors (CAAP) respectively.

AAB63232 to AAB63467, AAB63468 to AAB63721 and AAB63722 to AAB63970 represent human breast, gastric and prostate CAAP protein sequence respectively. CAAPs have cytostatic activity and can be used in the production of cancer vaccines. The human CAAP proteins, peptides, nucleic acids or anti-CAAP antibodies are useful for diagnosing and treating a condition characterised by expression of an abnormal amount of a protein,
                                                                                                                                                                                                                                            Nucleic acids encoding breast, gastric and prostate cancer associated antigen precursors, useful for diagnosing and treating a condition characterized by expression of an abnormal amount of a protein, e.g.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AAF22422 to AAF22626, AAF22627 to AAF22773 and AAF22774 to AAF23014 represent nucleotide sequences encoding human breast, gastric and prostate cancer associated antigen precursors (CAAP) respectively.

AAB65232 to AAB63467, AAB63468 and prostate CAAP) respectively. represent human breast, gastric and prostate CAAP protein sequence respectively. CAAPS have cytostatic activity and can be used in the production of cancer vaccines. The human CAAP proteins, peptides, nucleic acids or anti-CAAP antibodies are useful for diagnosing and treating a condition characterised by expression of an abnormal amount of a protein,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human gastric cancer associated antigen protein sequence SEQ ID NO:944.
                                                                                         Human gastric cancer associated antigen protein sequence SEQ ID NO:940.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Nucleic acids encoding breast, gastric and prostate cancer associated antigen precursors, useful for diagnosing and treating a condition characterized by expression of an abnormal amount of a protein, e.g.

                                                                                                      The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticidaes, therapeutics and pharmaceutical furges. The invention discloses genomic DNA sequences (ABLIG176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Cytostatic; immunosuppressive; nootropic; neuroprotective; antiviral; antialergic; hepatotropic; antidiabetic; antiinflammatory; antiuloer; vulnerary; anticonvulsant; antibacterial; antifungal; antiparasitic; cardiant; gene therapy; cancer; immune disorder; cardiovascular disorder; neurological disease; infection; human; secreted protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequences AAB37984-B38019 represent the amino acid sequences of 27 human secreted proteins encoded by the genes AAC69084-C69119. The genes and proteins are useful for preventing, ameliorating or treating medical conditions, e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic
                                                                                                                                                                                                                                                The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wlpo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New nucleic acid molecules encoding 27 human secreted proteins for diagnosing, preventing, treating or ameliorating medical conditions and used as food additives or preservatives -
New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       human secreted protein encoded by gene 18 clone HKAFH74.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Florence K;

            diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer, and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) candiovascular disorders such as myocardial ischaemias; (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and epilepsy; and (f) infectious diseases such as viral, bacterial, fungal and parasitic infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes an antibody that binds to a human protein (I) selected from: PRO1295; PRO1295; PRO1410; PRO1755; PRO1780; PRO4341, PRO1927; PRO32567; PRO1295; PRO21303; PRO4346; PRO4354; PRO4397; PRO4407; PRO1555; PRO1096; PRO2038; and PRO2262. (I) has anticancer activity and can be used to diagnose tumours in mammals, by detecting complex formation when the antibody is contacted with test cells. Increased expression of genes encoding (I) can also be detected to diagnose tumours. Agents which inhibit the activity of (I), especially the antibodies, or an antisense oligonucleotide which hybridises to genes encoding (I), can be used to inhibit tumour growth,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Antibodies specific for PRO polypeptides, used to diagnose and inhibit the growth of tumors in mammals, and to identify inhibitors of PRO polypeptide activity or expression -

      ö
preferably by inducing cell death. Methods from the present invention can be used to identify compounds which inhibit the biological activity of (I). AAC58019 to AAC58102 represent PCR primers and hybridisation probes used in examples from the present invention for human PRO sequences. AAC58103 to AAC58122 and AAB24021 to AAB24040 represent human PRO polynucleotide and protein sequences given in the exemplification of the present invention.

                                                                                                                                                                                                                                        Secreted and transmembrane proteins and nucleic acids designated PRO, useful as hybridization probes, in chromosome and gene mapping and gene
                                                                                                                                                                                                                                                                                                                              These proteins and the DNA encoding them may be used as hybridization probes, in chromosome and gene mapping and in the generation of anti-sense RNA and DNA. They may also be used used to generate either transgenic animals or knockout animals which are in turn useful for development and screening of therapeutically useful reagents. The nucleic acids may also be used in gene therapy.
                                                                                                                                                                                                                                                                                                                     The present invention relates to secreted and transmembrane proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human insulin-like growth factor binding protein-like polypeptide #3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  "Mature human IGFBP-like polypeptide #3"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                            AAA37022 to AAA37144 encode the new isolated human transmembrane, receptor or secreted PRO polypeptides given in AAY99340 to AAY99462. The transmembrane and receptor PRO proteins can be used for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interactions. The polypeptides and nucleotide sequences encoding then have various industrial applications, including uses as pharmaceutical and diagnostic agents. AAA37145 to AAA3730 represent PCR primers and hybridisation probes used in the isolation of the PRO
                                                                                                                                                                                                                                                                                                                                    ^{\rm or}

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL016175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                  detection reagent for detecting 1000 or more for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; chromosome mapping; gene mapping; gene therapy; forensic; food supplement; medical imaging; diagnostic; genetic disorder.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        protein-like (IGEBP-Like) polypeptides and their associated polymerlectides. The DNA sequences can be detected by contacting a sample with nucleic acid primers that anneal to the DNA and amplifying a product comprising a portion of the sequence. Detection of the product indicates the presence of DNA. The protein sequences can be detected by contacting a sample with a compound that binds to the polypeptide to form a complex. Detection of the complex indicates the presence of the protein. The sequences of the invention are useful for treating a subject having a need to inhibit activity or expression of IGFBP-like sequences. This that inhibits the expression of the polypeptide, a polynucleotide amount of the polypeptide that competes for its ligand and a carrier. The sequences are useful in treatment of disorders such as cancer, or to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 sequences are useful in treatment of disorders such as cancer, or to promote female reproductive health and embryo development. They can also be used in food supplements, in medical imaging and in gene mapping. The sequences can be used in the treatment and prevention of autoimmune diseases, nervous system diseases, cerebrovascular diseases and infertility and for enhancing wound healing. This sequence represents a
                                                                                                                                                                                                                                                                         New insulin-like growth factor binding protein-like polypeptide and encoding polynucleotides, useful for treating cancer, infertility, and arthritis, and for increasing wound healing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to isolated insulin-like growth factor binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Drosophila; developmental biology; cell signalling; insecticide;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PGP) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags of orientifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical maging of sites expressing (II). (I) and (II) are useful in medical in medical clasorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in claspnostics, forensics, gene mapping, identification of mutations and to produce other types of data and products dependent on DNA and and cannon acid sequences. ABG00010-ABG30377 represent novel human
                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Insulin-like growth factor binding protein; IGFBP; human; cancer; female reproduction; embryo development; food supplement; gene mapping; medical imaging; autoimmune disease; nervous system disease; cytostatic; cerebrovascular disease; wound healing; gynaecological; antiinfertility;
                                                                                                                                                                                                                                                                        Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New insulin-like growth factor binding protein-like polypeptide and encoding polynucleotides, useful for treating cancer, infertility, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human insulin-like growth factor binding protein-like polypeptide #2.
                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                ;

protein-like (IGFBP-like) polypeptides and their associated protein-like (IGFBP-like) polypeptides and their associated polynucleotides. The DNA sequences can be detected by contacting a sample with nucleic acid primars that anneal to the DNA and amplifying a product comprising a portion of the sequence. Detection of the product indicates the presence of DNA. The protein sequences can be detected by contacting a sample with a compound that binds to the polypeptide to form a complex. Detection of the complex indicates the presence of the protein. The sequences of the invention are useful for treating a subject having a need to inhibit activity or expression of IGFBP-like sequences. This involves administering an antagonist of the polypeptide, a polymeric that inhibits the expression of the nucleotide sequence or a therapeutic amount of the polypeptide that competes for its ligand and a carrier. The sequences are useful in treatment of disorders such as cancer, or to promote female reproductive health and embryo development. They can also be used in food supplements, in medical imaging and in gene mapping. The sequences can be used in the treatment and prevention of autoimmune diseases, nervous system diseases, cerebrovascular diseases and the plancing wound healing. This sequence represents a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Neuroprotective; cytostatic; dermatological; immunosuppressive; tumour; antiinflammatory; anti-HIV; antibacterial; antiinflammatory; cancer; immune system disorder: rheumatoid arthritis; inflammatory condition; organ transplant rejection; infection; hepatitis C: blood disorder; solche cell anaemia; hyperproliferative disorder; Gaucher's disease; neurodegenerative disorder; Alzheimer's disease; prakinson's disease; chromosomal abnormality; bown syndrome; ischaemia; renal disorder; cardiovascular; respiratory; wound healing; endocrine; Addison's disease; reproductive system; gastrointestinal; liver disorder; AIDS; acquired immune deficiency syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, complymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving to restore normal activity of (II) or to treat disease states involving quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations in responsible for genetic disorders or other traits to assess biodiversity
 ö
 nseq
can be used to detect MAP antigens. The nucleotide sequences can be use as probes or primers for detecting MAP nucleic acids. The nucleotide sequences, polypeptides, 'vectors, (pseudo)viral particles, transformed cells and compounds selected by the screening assay can be used in pharmaceutical compositions. The polypeptides, nucleotide sequences, vectors and transformed cells can be used in vaccines against MAP circovirus infection. The vectors (pseudo)viral particles and transformed cells can be used for gene therapy.

 The present invention provides a number of nucleotide and protein sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from Coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacteria are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, and the examplification of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the
and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

 The present invention relates to single exon nucleic acid probes for measuring human gene expression in a sample derived from human heart (see ABA11535-ABA41305). The present sequence is a protein enroced by one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays.
 measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
 Protein #5835 encoded by probe for measuring heart cell gene expression

 Human brain expressed single exon probe encoded protein SEQ ID NO: 31555.
 The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is a protein encoded by one of the probes of the invention.
 printed
By measuring gene expression, the probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human heart and vascular system e.g. cardiovascular disease, hypertension, cardiac arrhythmias and congenital heart disease. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

The present invention relates to human single exon nucleic acid probes (SENP: see AAI10068-AAI28459). The present sequence is a peptide encoded by one such probe. The SENPs are derived from human HeLa cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably
 Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

Claim 11; SEQ ID NO 12498; 3071pp + Sequence Listing; English.

AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (I) amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic activity, and can be used in gene therapy and vaccine production. (I) proteins and polynuclectides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (I) expression. For example, they may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of (I) by expressing inactive proteins or to supplement the patients own production of (I). Additionally, (I) supplement the patients own production of (I). Additionally, (I) to protein. (I) proteins and polynucleotides may be used to prevent, diagnose and treat immune/haematopoietic-related diseases, especially cancers and cancer metastases of haematopoietic antigen genomic sequences from the present invention. AAK54942 to AAK5950 and AAM82169

```

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The present invention describes a diagnostic method for detecting human kallikrein 2 (hR2) DNA. The method comprises: (a) contacting DNA obtained by reverse transcription (RT) of RNA from a human physiological sample which comprises cells suspected of containing hK2 RNA with at least 2 oligonuclectides to amplify the DNA by PCR to yield amplified hK2 DNA, where the conditions amplify the DNA by hich comprises at least 10 one cell containing hK2 in a sample which comprises at least 107 to 109 method can be used for detecting the presence of the amplified hK2 DNA. The method can be used for detecting, monitoring the progression of and pathologically staging prostate cancer. The present sequence represents prostate-specific glandular kallikrein protein (phk2).

 Human pro-hK2 (AAR84669) is a precursor form of a prostate-specific glandular kallkrein (AAR84667) useful in the development of prods. used in the diagnosis and monitoring of prostate cancer. Pro-hK2 is obtd. by expression in prokaryotic (E. coli) or eukaryotic (insect, mammalian) cells of cDNA (AAT05149) derived from human benign prostatic hyperplasia

 This polypeptide comprises human prostate-specific glandular kallikrein precursor pro-hk2 (phk2). It is encoded by CDNA (see AAV06603) derived from human benign prostate hyperplasia (BPH) tissue contacting antibodies that specifically bind to pro-hk2 or mature hk2 (see AAW45395) with a sample of physiological fluid from a human. The assay is based on the discovery that phk2 is detected in the supernatant of a prostate carcinoma cell line and that hk2 is present in human physiological fluid from prostate cancer cells. The method is useful for monitoring the treatment and/or prostate cancer in males that have BPH or a high grade prostatic neoplasia (HPGN) or whose family members have or had BPH, HPGN or a prostate cancer. Monitoring the presence and/or amount of hk2 complexes with plasma proteins may also be important in distinguishing between prostate cancer and BPH.

breast cancer cells when stimulated by androgens. Detecting levels of hK2 may provide a simple diagnostic tool for detecting or determining breast cancer. Detecting hK2 is achieved by producing an hK2 DNA from hK2 RNA by reverse transcription. The hK2 DNA obtained is then amplified by PCR and detected using probes. Determination of breast cancer may also be determined by exposing the hK2 polypeptide to an agent which binds to it and then detecting the binary complex formed. The amount of complex formed correlates directly to the presence of breast cancer in the human individual. The methods can be used in the diagnosis, treatment and/or monitoring of the progression or remission of breast cancer and/or

 SUBUNIT: THE SODIUM CHANNEL CONSISTS OF A LARGE POLYPEPTIDE AND 2-3 SMALLER ONES. THIS SEQUENCE REPRESENTS A LARGE POLYPEPTIDE. SUBCELULAR LOCATION: Integral membrane protein.

DOMAIN: THE SEQUENCE CONTAINS 4 INTERNAL REPEATS, EACH WITH 5 HYDROPHOBIC SECHENTS (SI,S2,S3,S5,S6) AND ONE POSTITIVELY CHARGED SEGMENT (S4). SEGMENTS S4 ARE PROBABLY THE VOLTAGE-SENSORS AND ARE CHARACTERIZED BY A SERIES OF POSITIVELY CHARGED AMINO ACIDS AT

Bukaryota; Neoptera; Endopterygota; Diptera; Brachycera; Muscomorpha;

Ephydroidea; Drosophilidae; Drosophila.
 BDGG4GHEIMER M.;
Submitted (DEC-1996) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: INVOLVED IN THE CONTROL OF CELL PROLIFERATION IN
IMAGINAL DISCS. MAY BIND TO CERTAIN PROTEINS OF SIGNAL
TRANSDUCTION PATHWAYS BY INTERACTION WITH THEIR SH3 DOMAINS.
-!- SUBCELLIALMAR LOCATION: APICAL SURFACE OF DISC CELLS.
-!- DISEBASE: MUTATIONS OF EXPANDED PROTEIN CAUSE HYPERPLASMIA OF THE
IMAGINAL DISC RESULTING IN WING OVERGROWTH. THIS OVERGROWTH IS
LIMITED TO SPECIFIC REGIONS ALONG THE 2 WING AXES. DEFECTS ALSO
IN EYES, HEAD, THORAX AND LIMBS WHERE DUPLICATION AND BULGING
OFTEN OCCUR.

 ö
macrosialin, a macrophage-restricted protein.";
Genomics 50:199-205(1998).

-! FUNCTION: COULD PLAY A ROLE IN PHAGOCYTIC ACTIVITIES OF TISSUE
MACROPHAGES, BOTH IN INTRACELLULAR LYSOSOMAL METABOLISM AND
EXTRACELLULAR CELL-CELL AND CELL-PATHOGEN INTERACTIONS.
BIND TO TISSUE- AND ORGAN-SPECIFIC LECTINS OR SELECTINS, ALLOWING
HOWING OF MACROPHAGE SUBSETS TO PARTICULAR SITES. RAPID
RECIRCULATION OF CD68 FROM ENDOSOMES, LYSOSOMES TO THE PLASMA
MEMBRANE MAY ALLOW MACROPHAGES TO CRAWL OVER SELECTIN BEARING
SUBSETRATES OR OTHER CELLS.

-!-SUBGELLULAR LOCATION: TYPE I MEMBRANE PROTEIN. ENDOSOMAL OR
LYSOSOMAL (LONG VARIANT) AND TO A LESSER EXTENT ON THE CELL
SUBREACE (SHORT VARIANT).

Suppressor protein SSL1 - yeast (Saccharomyces cerevisiae)

N.Alternate names: protein L1531; protein YLR005w
C; Species: Saccharomyces cerevisiae
C; Date: 18-May-1994 #sequence\_revision 19-Jul-1996 #text\_change 20-Jun-2000
C; Accession: A46394; S64827
R; Yoon, H; Miller, S.P.; Pabich, E.K.; Donahue, T.F.
Genes Dev. 6, 2463-2477, 1992
A; Title: SSL1, a suppressor of a HIS4 5'-UTR stem-loop mutation, is essential for transpreace number: A46394; MUID:94040711
A; Recence number: A46394; MUID:94040711
A; Accession: A6394; MUID:94040711
A; Accession: A6394; MUID:9409711
A; Molecule type: DNA
A; Residues: 1-461 < YOO>
A; Residues: 1-461 < YOO>
A; Residues: 1-461 < YOO>
A; Residues: S64142
A; Reference number: S64442
A; Reference number: S64827

Matrix metalloproteinase (EC 3.4.24.-) membrane type precursor - rat
N'Alternate names: membrane-type metalloproteinase
C'Species: Rattus norvegicus (Norway rat)
C'Species: Rattus: Rat71: I61946
R'Okada, A.; Bellocq, J. P.; Rouyer, N.; Chenard, M.P.; Rio, M.C.; Chambon, P.; Basset
Proc. Natl. Acad. Sci. U.S.A. 92, 2730-2734, 1995
A;Trile: Membrane-type matrix metalloproteinase (MT-MMP) gene is expressed in stromal
A;Reference number: I38046; MUID:95244014

 The invention relates to isolated polynuclectide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical immaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in
 screening for stratum corneum chymotrypsin enzyme (SCCE). Proteases are considered to be an integral part of tumour growth and metastasis, and therefore, markers indicative of their presence or absence are useful for the diagnosis of cancer. The method is useful for diagnosing cancer, carcinome and malignant hyperplasia. The SCCE oligonucleotide may be used to treat a cancer selected from ovarian, breast, lung, colon, prostate and other cancers in which SCCE is overexpressed. The present sequence is
 invention relates to diagnosing cancer especially ovarian cancer, by

diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
 The enzyme encoded by this sequence is used in pharmaceutical, cosmetic

 Human amyloid precursor protein protease (AAW05383) is involved in the processing or clearance of amyloid precursor protein to form beta-amyloid peptide. Its amino acid sequence was deduced from a cDAA clone (AAT397883) obtd. from a human lung library. Recombinant (Partic. E. coli) or eukaryotic (partic. AV-120 host cells. It is used to develop products for the design and testing of cpds. useful for treating or preventing conditions associated with beta-amyloid peptide, esp. Alzheimer's disease.

(HSCEE), a member of the kallikrein multi-gene family. Kallikreins and kallikrein-like proteins are a subgroup of the serine protease enzyme family. They catalyse the selective cleavage of specific polypeptide proteases peptides with potent biological activity. Nucleic KLK-L5 and KLK-L6 have been isolated. The proteins are useful in the treatment, monitoring and diagnosis of cancers, especially prostrate with or mediate the biological activity of the proteins. Antibodies can be used to identify a substance that can associate with or mediate the biological activity of the proteins. Antibodies can be used to treat conditions mediated by the kallikrein-like proteins.

The invention relates to diagnosing cancer especially ovarian cancer, by screening for stratum corneum chymotrypsin enzyme (SCCE). Proteases are considered to be an integral part of tumour growth and metastasis, and therefore, markers indicative of their presence or absence are useful for the diagnosis of cancer. The method is useful for diagnosing cancer, to treat a cancer selected from ovarian, breast, lung, colon, prostate and other cancers in which SCCE is overexpressed. The present sequence is

The present invention describes secreted and transmembrane polypeptides and their polynucleotides. The nucleotide sequences are useful as sources of probes, primers, for chromosome mapping, and for generation of antisense sequences. They can also be used to create transgenic animals. The proteins can be used to treat a variety of diseases and disorders, depending on their function. Diseases that may be treated disorders. They may also be used to raise antibodies. AA234338, and AAX41685 to AAX41774 represent polynucleotide and in the exemplification of the present
 New secreted and transmembrane polypeptides and their polynucleotides, useful for treating blood coagulation disorders, cancers and cellular adhesion disorders .

This sequence represents a polypeptide of the invention, and is an asparty1-type protease, designated CSP56. The polynucleotides (PNS) of the invention encode metastatic marker protein variants. The pus and polypeptides can be used as markers for cancer metastasis. The products can be used for identifying metastatic tissue or metastatic potential of a tissue, e.g. breast or colon tissue. They can also be used for screening test compounds for the ability to suppress the metastatic potential of potential of a tumour. The products can be used for developing products for the therapy of cancers, particularly breast or colon cancer.

AAC78458 to AAC78599 represent polynucleotide and EST (expressed sequence tag) sequences which encode secreted or transmembrane PRO polypeptides. The PRO polynucleotides and polypeptides have cytostatic activity. The polynucleotides and polypeptides can be used for detecting the presence of PRO polypeptides in samples, for linking bioactive molecules to cells and for modulating biological activities of cells, using the polypeptides for specific targeting. The polypeptide targeting can be used to kill the target cells, e.g. for the treatment of cancers. The polypeptide pairs provide specific targeting of bioactive molecules to cells. AAC78600 to AAC78897 represent PCR primers and probes used in

This sequence represents the human aspartyl protease amino acid sequence.
The invention relates to a protease capable of cleaving the beta
secretases site of amyloid precursor protein (APP). The protease contains
a sequence encoding the amino acid sequence DTG and a sequence encoding
causes an autosomal dominant form of Alzheimer's disease. APP localises
to the cell surface membrane and have a single C-terminal transmembrane
ct to the cell surface membrane and have a single C-terminal transmembrane
ct which is possibly very important in Alzheimer's disease. The invention
ct includes a nucleotide sequence encoding the protease, a vector containing
ct houcleotide sequence, and a cell line comprising the vector. Methods
ct for screening for inhibitors of beta secretases activity are also given in
ct human aspartase protein and nucleotide sequences and
ct he invention. The human aspartase protein and nucleotide sequences and
ct the methods for identifying inhibitors of the protease, are useful in the

Sequences AAU29024-AAU29328 represent PRO polypeptides of the invention.

The PRO polypeptides and their associated nucleic acids can be used to detect the presence of a tumour in a mammal by comparing the level of detect the presence of a tumour in a mammal by comparing the level of and a control sample of normal cells, whereby a higher level of expression in the test sample indicates the presence of a tumour in the animal mammal. Mammals include dogs, cats, cattle, horses, sheep, plgs, goats and rabbits but are preferably human. The polypeptides can be used to stimulate tumour necrosis factor (TMP) alpha release from human blood, when contacted with it. A specific polypeptide can be used to stimulate the proliferation or differentiation of chondrocyte cells. The PRO proteins can be used to determine the presence of tumours and also susceptibility to tumour development, particularly adrenal, lung, colon, breast, prostate, rectal, cervical, or liver tumours, in mammalian subjects. The oligonucleotide probes specific for the PRO nucleic acids can be used for genetic analysis of individuals with genetic disorders.

The invention relates to human aspartyl proteases (Hu-Asp), beta-amyloid precursor protein (APP) isoforms and their corresponding DNA molecules. Thuman aspartyl proteases can act as beta-secretase proteases useful for teating Alzheimer's disease. APP isoforms are useful for identifying treatment's disease. APP isoforms are useful for identifying characteristic for the treatment and prevention of Alzheimer's disease, and neuronal loss. APP isoforms are also used in methods for identifying can neuronal loss. APP isoforms are also used in methods for identifying cc of an method for identifying agents that modulate the activity of human continuous and modulators of human ASP2 activity. The invention relates aspartyl protease ASP2. Amyloid-beta peptides obtained from APP are used continuous as a means to screen in cellular assays for the inhibitors of beta- and colymerase chain reactions (PCR). The probes are useful dolymerase chain reactions (PCR). The probes are useful for detecting colours. The present sequence is human aspartyl protease I (Hu-Asp1).

 ö
 The present invention relates to enzymes for cleaving the alphasescretase site of the amyloid precursor protein (APP) and methods of identifying those enzymes. The methods may be used to identify enzymes that may be used to cleave the alpha-secretase cleavage site of the APP protein. The enzymes may be used to treat or modulate the progress of Alzheimer's disease. The present sequence is human Aspartyl protease-1 (ASP-1) deltaTM (His)6 protein which is used for the expression of pre-pro-human-Aspartyl protease 1 (ASP1). This protein is obtained by replacing C-terminal transmembrane and cytoplasmic domains with a hexahistidine purification tag in the human Aspartyl protease 1.
 Gaps
 Enzymes that cleave the alpha-secretase site of the amyloid precursor protein, useful for the treatment of Alzheimer's disease -

human secreted proteins AAC93422 - AAC93449 represent CDNA encoding human secreted proteins AAB51724 - AAB51777. Sequences AAB51778 - AAB51825 represent alternative polypeptides encoded by the genes, and amino acid sequences to which they are homologous. The genes and proteins have activities dependent on the tissues and cells in which they are hardenessed. Examples of their activities include immunosupressive; antiarchritic; antirheumatic; antiproliferative; cytostatic; cardiant; vasotropic; cerebroprotective; noctropic; neuroprotective; antibacterial; virucide; fungicide; opthalmalogical; and vulnerary. The secreted proteins, polynucleotides, antagonists and agonists may be useful in treating, preventing and/or diagnosing diseases and disorders such as autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative disorders e.g. neoplasms of the breast or liver; cardiovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. hifections caused by bacteria, viruses and fungi and ocular disorders e.g. corneal infection. The polypetides can also be used to aid wound healing and epithelial cell proliferation, to prevent skin aging due to subburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotaxis. The polypeptides can also be used as a food additive or preservative to increase or decrease storage capabilities, fat content, lipid, protein, carbohydrate, vitamins, minerals, cofactors and other nutritional components. Oligonucleotide AAC93413 and other nutritional and characterisation of the proteins and

 This sequence represents a secreted human protein encoded by the nucleic deposited designated Gene 36 from the human cDNA clone HHPBD40 (deposited as clone ATCC 97898 and ATCC 209044).

The gene can be used to generate fusion proteins by linking to the gene stability of the fused protein as compared to the human protein only. The invention relates to 186 novel genes and their fragments (nucleic stability of the fused protein as compared to the human protein only. The invention relates to 186 novel genes and their fragments (nucleic sci sequences: AAV55511-V59812; amino acid sequences AAW74731-W75026) which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also, pathological conditions can be diagnosed by determining the amount of the new polynucleotides. Specific uses are described for each of the 186 polynucleotides, based on which tissues they are most highly expressed in

 The invention relates to novel human secreted polypeptides. The determining the presence of or predisposition to a disease associated with altered levels of polypeptide. The polypeptides are also useful for identifying agents (agonists and antagonists) that bind to them. Cells dentifying agents (agonists and antagonists) that bind to them. Cells for use in treatment of a pathology related to aberrant expression or physiological interactions of the polypeptide. Vectors comprising the nucleic acids encoding the polypeptides and cells genetically engineered to express them are also useful for producing the proteins. The proteins are useful in genetic vaccination, testing and therapy, and can be used as nutritional supplements. They may be used to home contributed to a partial contribute the contribute of the contr

 The present sequence represents a human monocyte-derived protein. The specification describes monocyte-derived proteins FDF03, FDF03DeltaTW, FDF03-M1, and FDF03-S2. The proteins are involved in the regulation, or development, of haematopoletic cells. Antibodies specific for antigenic components of the proteins can be used to detect the components in samples. The proteins can also be used to screen for candidate therapeutic agents. The monocyte-derived proteins and polynucleotides can be used for diagnosis of diseases related to an increase, or decrease, in the number of monocytes in a tissue or lymph system, such as monocyte hyperplasia, tissue or graft rejection, inflammation, or bacterial or viral infections. The proteins can also be used in the treatment of disorders associated with abnormal expression or signalling by a monocyte.
 Gaps

 Signal-peptide-containing molecules leucocyte-specific protein-1 (LSP-1), prolification analog I (PA-I) and thrombopoietin analog protein-1 (LSP-1), proliferin analog I (PA-I) and thrombopoietin analog protein I (TAP-1).

These proteins have antianglogenic, antiantory, anti-inflammantory, anti-arthritic and anti-thrombocytopenic activity. The products of the invention and their modulators are involved in signal transduction, inflammatory responses, growth, proliferation, differentiation and survival of cells; anglogenesis; maturation of haematopoletic stem cells and erythroid precursors megakaryocytopolesis and thrombopoiess.

CC and erythroid precursors megakaryocytopolesis and monitoring of treatment of diseases. Other uses include chromosome mapping, identification of invention are useful for diagnosis, prognosis and monitoring of treatment of diseases. Other uses include chromosome mapping, identification of andlogenesis, immune responses associated with centering and nucleic acids are modulators of cellular processes, particularly they are used to treat or prevent diseases associated with centers, arthritis (and other inflammatory diseases), thrombocytopenia cencer, arthritis (and other inflammatory diseases), thrombocytopenia

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polypeptide (II) sequences. (I) is useful as hybridisation probes, colyments are dish reaction (PGR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags confidentifying expressed genes. (I) is useful in gene therapy techniques confidentifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving an applyabile in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating clasorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in cappositics, forensics, gene mapping, identification of mutations and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human can amino acid sequences of the invention.

Note: The sequence data for this patent did not appear in the printed sequence. The sequence as the full not appear in the printed sequence.

 This represents a human secreted protein. The specification provides secreted protein sequences (AAW63681 to AAW6369) encoded by the nucleic acid sequences shown in AAV43601 to AAV43619. The invention provides a method of identifying a secreted polypeptide which is modified by rough incrosomes. The secreted proteins can be used in assays to determine allocations, such as cytokine, cell proliferation, or cellular differentiation activities, tissue growth or regeneration, activin or inhibin activity, chemotactic or chemokinetic activity, hamostatic or thrombolytic activity, receptor/ligand activity, tumour inhibition, or anti-inflammatory activity. The proteins can also be used as continuation activity, receptor/ligand activity, tumour inhibition, or anti-inflammatory activity. The proteins can liso be used as continuation in protein interaction assays, to identify ligands or binding conteins. Compounds which affect the biological activities of the secreted proteins or their ability to interact with specific ligands can be identified using the proteins in screening assays. The proteins and antibodies that bind specifically to the protein can also be used to design diagnostic tests and therapeutic compositions for diseases which may be associated with altered expression of these proteins. Fusion proteins comprising, e.g. signal sequences or transmembrane domains of the proteins can be used to carget other protein domains to cellular.

The present sequence represents a human protein, FDF03, which is a type I transmembrane protein comprising an extracellular portion characterised by immunoglobulin-like domains, indicating that the protein is a receptor member of the immunoglobulin superfamily. The FDF03 gene is found in activated monocytes. The specification also describes other proteins encoded by activated monocytes, which are designated YBO1 and ATF03. The genes function in controlling development, differentiation, and/or physiology of the mammalian immune system. The products can be used for treating abnormal proliferation, regeneration, degeneration or atrophy. They can be used for treating e.g. cancerous conditions, degenerative conditions, autoimmune responses, transplantation rejection, graft versus host disease, or inflammatory conditions. The products can also be used for detection, diagnosis and drug screening.

 ò
 q
 specification describes monocyte-derived proteins FDF03, FDF03beltaTW, FDF03-N14, and FDF03-S2. The proteins are involved in the regulation, or development, of haematopoietic cells. Antibodies specific for antigenic components of the proteins can be used to detect the components in samples. The proteins can also be used to screen for candidate therapeutic agents. The monocyte-derived proteins and polynucleotides can be used for diagnosis of diseases related to an increase, or decrease, in the number of monocytes in a tissue or lymph system, such as monocyte hyperplasia, tissue or graft rejection, inflammation, or bacterial or viral infections. The proteins can also be used in the treatment of disorders associated with abnormal expression or signalling by a monocyte.

Sequences ABB10981-ABB12330 represent 1350 novel human polypeptides, and sequences ABA08225-ABA09574 represent nucleic acids encoding them. The invention also relates to vectors and recombinant host cells comprising a nucleotide of the invention, methods of producing the novel polypeptides.

Conclectide of the invention, methods of detecting the nucleotides of polypeptides of the invention athough novel, many of the bind to polypeptides of the invention. Although novel, many of the polypeptides of the invention have homology to known proteins, thereby giving an insight into their probable biological activities, and hence potential therapeutic applications. The polypeptides of the invention and insight into their probable biological activities, and hence differentiation activities, including cytokine, cell proliferation or cell differentiation activities; sem cell growth factor activity; immunomodulatory activity; tissue growth activity; immunomodulatory activity; activin- or inhibin-related activities; chemotactic or chemokinetic activities; heamatopitic activities; polypeptides and nucleotides of the invention are useful for preventing, treating or ameliorating medical involved in oncogenesis, cancer cell proliferation or metastasis.

Conditions, e.g., by protein or gene therapy. Such conditions include cancers, heamatopoietic disorders (e.g., metological activities, polypeptides and nucleotides of actorial inclaimes to gene therapy. Such conditions, e.g., by protein or gene therapy. Such conditions include cancers, heamatopoietic disorders (e.g., metological or lymphoid cell correcters), chronic inflammatory conditions (e.g., asthma or arthritis), protein or gene therapy. Such conditions in cludes or arterial ischaemia bone disorders (e.g., metological or lymphoid cell conditions and uloces), while those with immunomodulatory activities may be used to promote cell growth. For example, such polypeptides may be used to pannal or lungal infections in addition to immune disorders (e.g., patential polypeptides wit
 that can be used to augment or replace calls damaged by lilness, autoimmune disease or accidental damage. The polypeptides and nucleotides may also be used in the disgnosts of the above conditions, and in drug screening techniques. The present sequence represents a novel human polypeptide of the invention.
